FlyBase

FlyBase: A Valuable Source of Molecular Interaction Data

Abstract

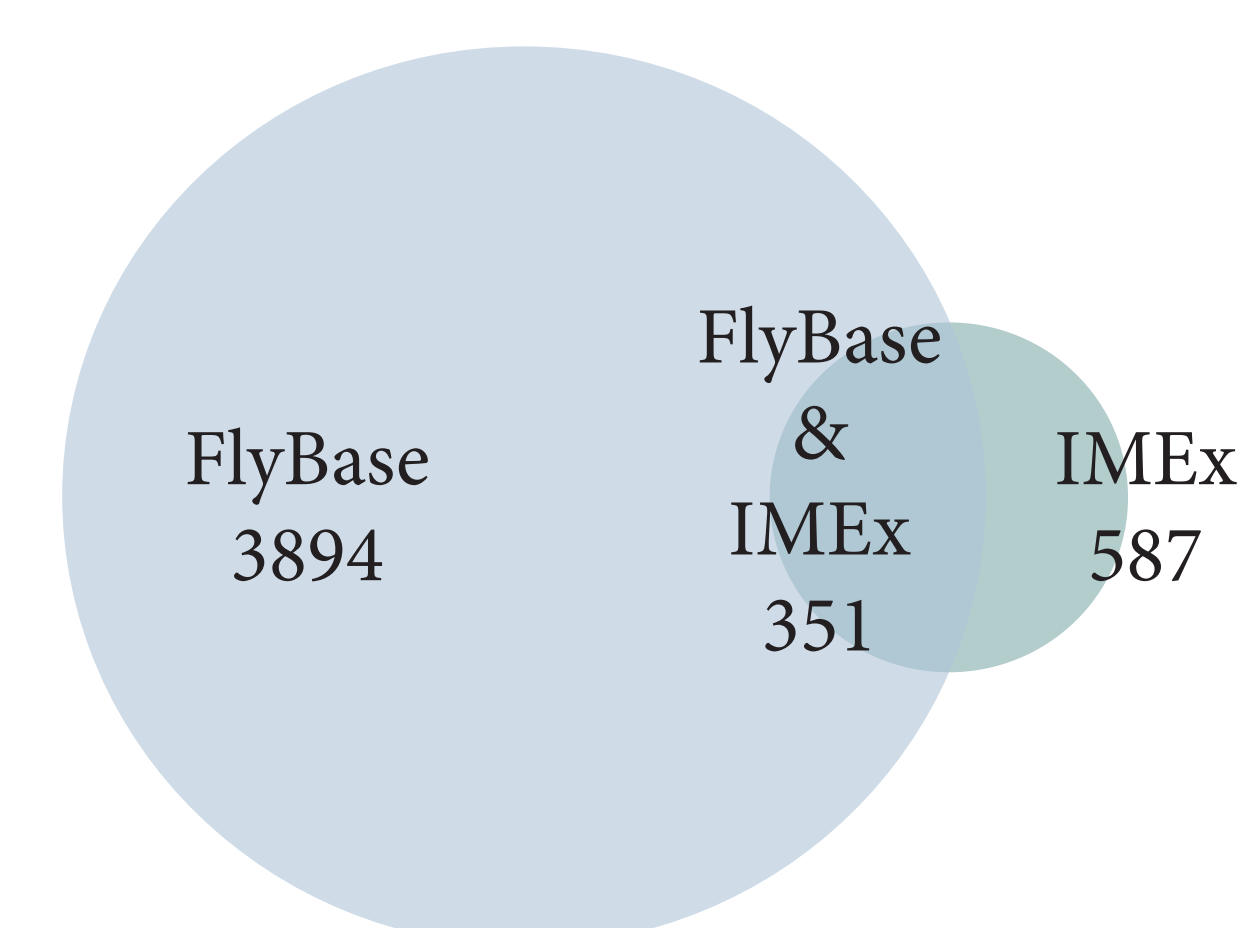

The knowledge of a molecule's binding partners can provide insights into that molecule's function and/or its involvement in a particular biological process. FlyBase curation of molecular interactions is primarily focused on capturing protein-protein, RNA-protein and miRNA-mRNA interactions from low-throughput studies, in which interactions are typically supported by multiple independent forms of evidence. By concentrating on low-throughput studies of *Drosophila* gene products, the FlyBase molecular interactions dataset complements that of interaction databases and consortia that tend to focus on high-throughput studies.

Drosophila Dataset Comparison

	FlyBase	IMEx	BioGRID
total interaction experiments	43,593	50,234	38,900
interspecies	38	508	208
protein-protein	40,900	50,102	na*
protein-RNA	2085	8	na*
RNA-RNA	608	0	na*
protein-DNA	0	104	na*
protein-small molecule	0	18	na*

FlyBase Interactions Display

FlyBase curated interaction data can be viewed in the "Interactions" section of every FlyBase gene page. The data is summarized as a network diagram where circles represent protein interactors and triangles represent RNA making it possible to distinguish protein-protein, protein-RNA and RNA-RNA interactions at a glance. Network diagrams are generated by Esyn (<http://www.esyn.org>).

hid - CG7675	two hybrid	(Hu et al., 2017.6.13)
hid - Diap1	pull down, anti tag western blot, anti tag coimmunoprecipitation, molecular weight estimation by staining, autoradiography, western blot, far western blotting, colocalization, fluorescence microscopy, inferred by author	(Morishita et al., 2013, Sandu et al., 2010, Leuller et al., 2006, Ryoo et al., 2002)

FlyBase also presents interaction data in tabular form where individual interaction experiments are condensed into unique gene pairs, or interacting groups. For each gene pair, assays used to detect interactions and references are listed.

Clicking on a particular interacting group or gene pair opens a new page with more detailed information. The interacting group page displays a network diagram that includes products of both genes and common interactors are highlighted in purple.

The interacting group page further presents details for each experiment showing an interaction involving products of the given gene pair. Details include the sources of the molecules, their bait or prey roles, portions of the molecules that are necessary or sufficient for the interaction or mutations that affect the interaction.

FlyBase shares the interaction data it curates with other databases like BioGRID, MIST, DroID and the Alliance of Genome Resources. Linkouts to these databases from FlyBase allow users to quickly explore large and diverse datasets.

The complete corpus of FlyBase interaction data is available for download under the 'Downloads' menu.

Conclusion

FlyBase curates interaction data that complements that captured by other databases making FlyBase a valuable source of *Drosophila* interaction data.
